8. Precaution in use

8.1 Soldering Conditions

- When soldering DIP LED , Heat may affect the electrical and optical characteristics of the LEDs.
- In soldering, do not stress the lead frame and the resin part under the high temperature.
- The epoxy part should be protected from mechanical stress or vibration until the DIP LEDs return to room temperature after soldering.
- Preliminary heating to be at 120~150°C max. for 120 Seconds max.
- Soldering heat to be at 260°C max. for 5sec. Max.
- For manual Soldering is Not more than 3sec @MAX350°C , under soldering iron

8.2 Storage

- Use within 7 days after opening packing. Store in 10 to 30 °C. DIP LED lead frames are plated Silver. The silver surface may be affected by environment which contain corrosive gases and so on. Please avoid condition which may cause the DIP LED to corroded, tarnish or discolor.

8.3 Static Electricity

- Static electricity or surge voltage damages the DIP LEDs. It is recommended that a wrist band or an anti-electrostatic glove be used when handling the LEDs.
- A tip soldering iron is requested to be grounded. An ionizer should also be installed where risk of static.
- All devices, equipment and machinery must be properly grounded (via 1MΩ). It is recommended that measures be taken against surge voltage to the equipment that mounts the DIP LEDs.

8.4 Cleaning

- Isopropyl Alcohol or Ethylene Alcohol is recommended in 5 minutes at room temperature. Don't use unspecified chemical may cause crack or haze on the surface of the epoxy resin.
- Before cleaning, a pre-test should be done to confirm whether any damage to the DIP LED will occur.
- Freon solvents should not be used to clean the DIP LEDs because of worldwide regulations.

10. Part Name Description

11. Attention : Electric Static Discharge (ESD) Protection

The symbol shown on the page herein to introduce 'Electro-Optical Characteristics'. ESD protection for GaP and AlGaAs based chips is still necessary even though they are safe in low static-electric discharge. Material in AlInGaP, GaP, or/and InGaN based chips are STATIC SENSITIVE devices. ESD protection has to be considered and taken in the initial design stage. If manual work/process is needed, please ensure the device is well protected from ESD during all the process.
